supervised learning

Linear regression with one variable

Model representation

Housing Prices (Portland, OR)

Price
(in 1000s
of dollars)

Supervised Learning

Given the “right answer” for each example in the data.

Regression Problem

Predict real-valued output → continuous

Classification: Discrete-valued output

Training set of housing prices (Portland, OR)

Size in feet ² (x)	Price (\$) in 1000's (y)
→ 2104	460
1416	232
→ 1534	315
852	178
...	...

} m = 47

Notation:

→ m = Number of training examples

→ x's = "input" variable / features

→ y's = "output" variable / "target" variable

(x, y) - one training example
 $(x^{(i)}, y^{(i)})$ - ith training example row

$x^{(1)} = 2104$
 $x^{(2)} = 1416$
 $y^{(1)} = 460$

Cost function
intuition I

Hypothesis:

$$\underline{h_{\theta}(x) = \theta_0 + \theta_1 x}$$

Parameters:

$$\underline{\theta_0, \theta_1}$$

Cost Function:

$$\rightarrow J(\theta_0, \theta_1) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

Goal: minimize $J(\theta_0, \theta_1)$
 $\nearrow \theta_0, \theta_1$

Simplified

$$h_{\theta}(x) = \underline{\theta_1 x}$$

$$\theta_0 = 0$$

$$\underline{\theta_1}$$

$$J(\theta_1) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

minimize $J(\theta_1)$
 θ_1 $\theta, x^{(i)}$

→ $h_{\theta}(x)$

(for fixed θ_1 , this is a function of x)

$J(\theta_1)$ = $\frac{1}{2m} \sum_{i=1}^3 (h_{\theta}(x^{(i)}) - y^{(i)})^2$

= $\frac{1}{2m} \sum_{i=1}^3 (\theta_1 x^{(i)} - y^{(i)})^2 = \frac{1}{2m} (0^2 + 0^2 + 0^2) = 0^2$

→ $J(\theta_1)$

(function of the parameter θ_1)

$\theta_1 = 0.5?$

$J(1) = 0$

$$h_{\theta}(x)$$

(for fixed θ_1 , this is a function of x)

$$J(0.5) = \frac{1}{2m} [(0.5-1)^2 + (1-2)^2 + (1.5-3)^2]$$

$$= \frac{1}{2 \times 3} (3.5) = \frac{3.5}{6} \approx \underline{0.58}$$

$$J(\theta_1)$$

(function of the parameter θ_1)

$$\theta_1 = 0?$$

$$J(0) = ?$$

$$h_{\theta}(x)$$

(for fixed θ_1 , this is a function of x)

$$J(0) = \frac{1}{2m} (1^2 + 2^2 + 3^2) = \frac{1}{6} \cdot 14 \approx 2.3$$

$$h(x) = -0.5x$$

minimize $J(\theta_1)$

Machine Learning

Linear regression
with one variable

Gradient
descent

Problem setup

Have some function $J(\theta_0, \theta_1)$ $J(\theta_0, \theta_1, \theta_2, \dots, \theta_n)$

Want $\min_{\theta_0, \theta_1} J(\theta_0, \theta_1)$ $\min_{\theta_0, \dots, \theta_n} J(\theta_0, \dots, \theta_n)$

Outline:

- Start with some θ_0, θ_1  (say $\theta_0 = 0, \theta_1 = 0$)
- Keep changing θ_0 , θ_1 to reduce $J(\theta_0, \theta_1)$
until we hopefully end up at a minimum

Gradient descent algorithm

repeat until convergence {

$$\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1)$$

}

assignment operator

θ_0, θ_1

learning rate

determine speed

(for $j = 0$ and $j = 1$)

Simultaneously update θ_0 and θ_1

Assignment

$$\begin{aligned} & \rightarrow a := b \\ & \quad \uparrow \\ & \quad a := a + 1 \end{aligned}$$

Truth assertion

$$a = b$$

$$a = a + 1 \quad \times$$

Correct: Simultaneous update

$$\rightarrow \text{temp0} := \theta_0 - \alpha \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$$

$$\rightarrow \text{temp1} := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$$

$$\rightarrow \theta_0 := \text{temp0}$$

$$\rightarrow \theta_1 := \text{temp1}$$

Incorrect:

$$\rightarrow \text{temp0} := \theta_0 - \alpha \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$$

$$\rightarrow \theta_0 := \text{temp0}$$

$$\rightarrow \text{temp1} := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$$

$$\rightarrow \theta_1 := \text{temp1}$$

$$\rightarrow \underline{\theta_j} := \underline{\theta_j} - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1)$$

learning
rate

derivative

(simultaneously update
 $j = 0$ and $j = 1$)

$$\min_{\theta_1} J(\theta_1)$$

$$\theta_1 \in \mathbb{R}.$$

$$\theta_1 := \theta_1 - \alpha \left(\frac{\partial}{\partial \theta_1} J(\theta_1) \right)$$

≥ 0

$\frac{\partial}{\partial \theta_1} \leftarrow$

$$\theta_1 := \theta_1 - \alpha \cdot (\text{positive number})$$

$$\frac{\partial}{\partial \theta_1} J(\theta_1)$$

≤ 0

$$\theta_1 := \theta_1 - \alpha \cdot (\text{negative number})$$

$\uparrow \qquad \qquad \uparrow$

$$\theta_1 := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_1)$$

If α is too small, gradient descent can be slow.

If α is too large, gradient descent can overshoot the minimum. It may fail to converge, or even diverge.

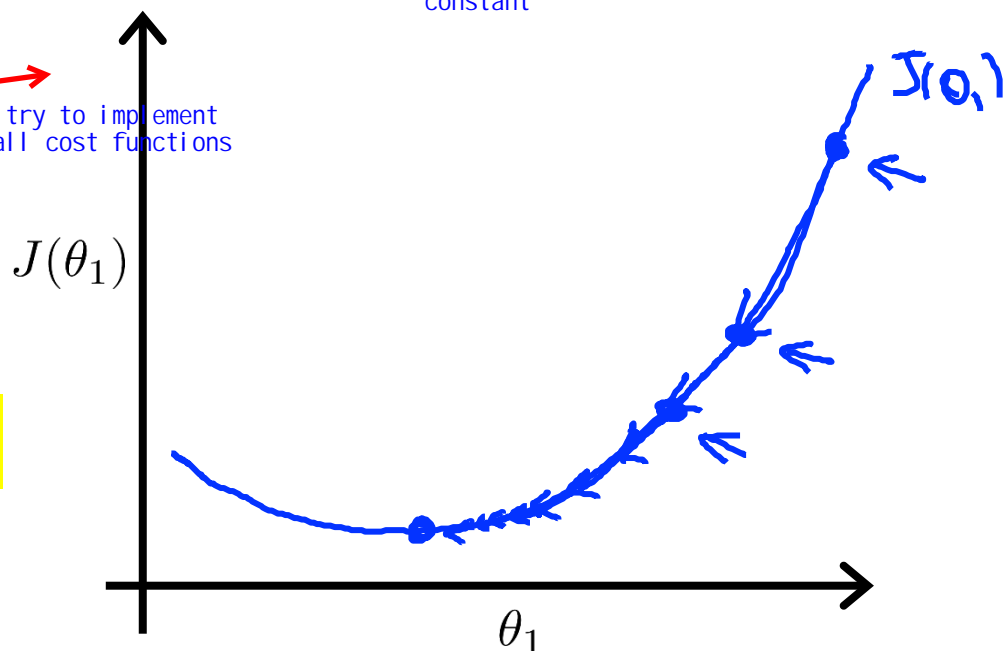

Gradient descent can converge to a local minimum, even with the learning rate α fixed.

$$\theta_1 := \theta_1 - \alpha \frac{d}{d\theta_1} J(\theta_1)$$

← can try to implement to all cost functions

As we approach a local minimum, gradient descent will automatically take smaller steps. So, no need to decrease α over time.

refers to we are looking at our entire batch of training examples

“Batch” Gradient Descent Alternative name

“Batch”: Each step of gradient descent uses all the training examples.

A handwritten blue equation representing the cost function for batch gradient descent. It shows a summation from $i=1$ to n of the squared difference between the hypothesis $h_\theta(x^{(i)})$ and the target $y^{(i)}$. A red arrow points from the word "Batch" in the title above to the summation symbol. A red horizontal line is drawn below the entire equation.

$$\sum_{i=1}^n (h_\theta(x^{(i)}) - y^{(i)})^2$$
